## **Support Vector Machines (SVM)**

**Date : 21/8/25**

### **Aim:**

To build an SVM model for a binary classification task, tune its hyperparameters, and evaluate it using accuracy, precision, recall, F1-score, confusion matrix, and ROC-AUC.

### **Algorithm:**

1. Import libraries: numpy, pandas, matplotlib, sklearn.
2. Load data: Use a standard binary dataset (Breast Cancer Wisconsin) from sklearn.datasets.
3. Train/Test split: 80/20 split with a fixed random\_state.
4. Preprocess: Standardize features (StandardScaler).
5. SVMs are sensitive to feature scale.
6. Model selection: Use SVC (RBF kernel).
7. Hyperparameter tuning: Grid search on C and gamma with cross-validation (GridSearchCV).
8. Train final model: Fit on training data using best parameters.
9. Evaluate: Predict on test set; compute metrics and plot ROC curve.
10. Report: Best params, metrics, and brief observations.

**OUTPUT:**

Best Parameters from Grid Search: {'C': 10, 'gamma': 0.01}

=== SVM (RBF) - Test Metrics ===

Accuracy : 0.9825

Precision: 0.9861

Recall : 0.9861

F1-Score : 0.9861

ROC-AUC : 0.9977

Confusion Matrix:

[[41 1]

[ 1 71]]

Classification Report:

	precision	recall	f1-score	support
0	0.98	0.98	0.98	42
1	0.99	0.99	0.99	72
accuracy			0.98	114
macro avg	0.98	0.98	0.98	114
weighted avg	0.98	0.98	0.98	114

### Result:

The Support Vector Machine (RBF kernel) model was successfully trained and tuned on the Breast Cancer dataset. After hyperparameter optimization, the model showed strong classification performance with balanced precision, recall, and F1-score. The ROC curve confirmed excellent class separability.
